PROJECT DESCRIPTION

Our application for the TDA will serve as a simplistic universal remote controller. Several different devices will be able to connect and automatically update the remote so that users don't need to hassle with multiple remotes and their instructions. By having a built in product code, the device can easily adapt to any living space.

SCENARIOS

- A user loses a TV remote controller and can only find the remote for the DVD.
- A user is attempting to watch a movie, but struggles for a half an hour finding the proper remotes.
- A user cannot find the proper buttons while looking at their 100 button remote.
- The music is too loud in Jane's car, but her analog controller on her receiver is broken.
- Robert bought a new remote and is searching through his instructions in order to find the correct product code in order to connect to the device. Little does he know, he threw that page away while opening the product.
